## Drought Creates Food Crisis in Central America

By DAVID GONZALEZ

**P**ILLADO, Honduras, Aug. 24 — A merciless and stubborn summer drought has left almost 1.5 million of the poorest farmers in Central America with no crops to sell or food to eat.

From Nicaragua to Guatemala, many of the region's poorest people have been reduced to scavenging for mangoes and bananas after seeing the bean and corn fields they planted months ago reduced to a crunchy tan carpet of withered stalks and wrinkled leaves.

Although the long-awaited rainy season has finished enough to sustain the year's second planting season, farmers are crippled by debt from the failed harvest, farmers

# Impacts of climate risk

**Catastrophic crop loss**

**Slow-down of individual progress**

**Slow-down of the local economy**

# Farmers cite weather as enemy no. 1

Table 1 Risk-related hardship faced by rural households in Ethiopia

Events causing of hardship	Percentage of households reported to have been seriously affected in last 20 years
Harvest failure (drought, flooding, frost, etc.)	78
Policy shock (taxation, forced labour, ban on migration, ...)	42
Labour problems (illness or deaths)	40
Oxen problems (diseases, deaths)	39
Other livestock (diseases, deaths)	35
Land problems (villagisation, land reform)	17
Assets losses (fire, loss)	16
War	7
Crime/banditry (theft, violence)	3

# Drought risk:

## Average income per household in Orissa

	Normal year (Rs)	Drought year (Rs)	Diff (%)
<b>Crop</b>	<b>12018</b>	<b>4210</b>	<b>-65</b>
<i>Rice</i>	<i>9290</i>	<i>2367</i>	<i>-74</i>
<i>Other crops<sup>1</sup></i>	<i>2728</i>	<i>1890</i>	<i>-31</i>
<b>Farm-labor</b>	<b>2474</b>	<b>1182</b>	<b>-52</b>
<b>Non-farm activities<sup>2</sup></b>	<b>4291</b>	<b>6661</b>	<b>55</b>
<b>Other sources</b>	<b>1317</b>	<b>1192</b>	<b>-9</b>
<b>Total Income</b>	<b>32117</b>	<b>17502</b>	<b>-46</b>
<b>Sale of livestock</b>	<b>72</b>	<b>1774</b>	<b>A<sup>4</sup></b>
<b>Sale of land</b>	<b>0</b>	<b>4768</b>	<b>A<sup>4</sup></b>
<b>Sale of other assets<sup>3</sup></b>	<b>0</b>	<b>2329</b>	<b>A<sup>4</sup></b>
<b>Mortgaging/Borrowing</b>	<b>0</b>	<b>3130</b>	<b>A<sup>4</sup></b>
<b>Total (asset sale + borrowing)</b>	<b>72</b>	<b>12001</b>	<b>A<sup>4</sup></b>

<sup>1</sup>Other crops include vegetables, oilseeds, pulses and other cereals.

<sup>2</sup>These includes plucking of leaves, *sal and sabai* and fruit sales.

<sup>3</sup>Other assets include farm implements, utensils, jewelry, timber, trees and bamboo.

<sup>4</sup>The percentage difference was not calculated because the values for normal year were zero or close to zero.

# How can insurance help?

- **Allows reasonable risk-taking**
- **Increases access to credit**
- **Enables investment in biological and financial capital**

**Insurance is a tried and tested mechanism to cope with risk**

**Insurance is used  
widely in  
developed  
economies...**

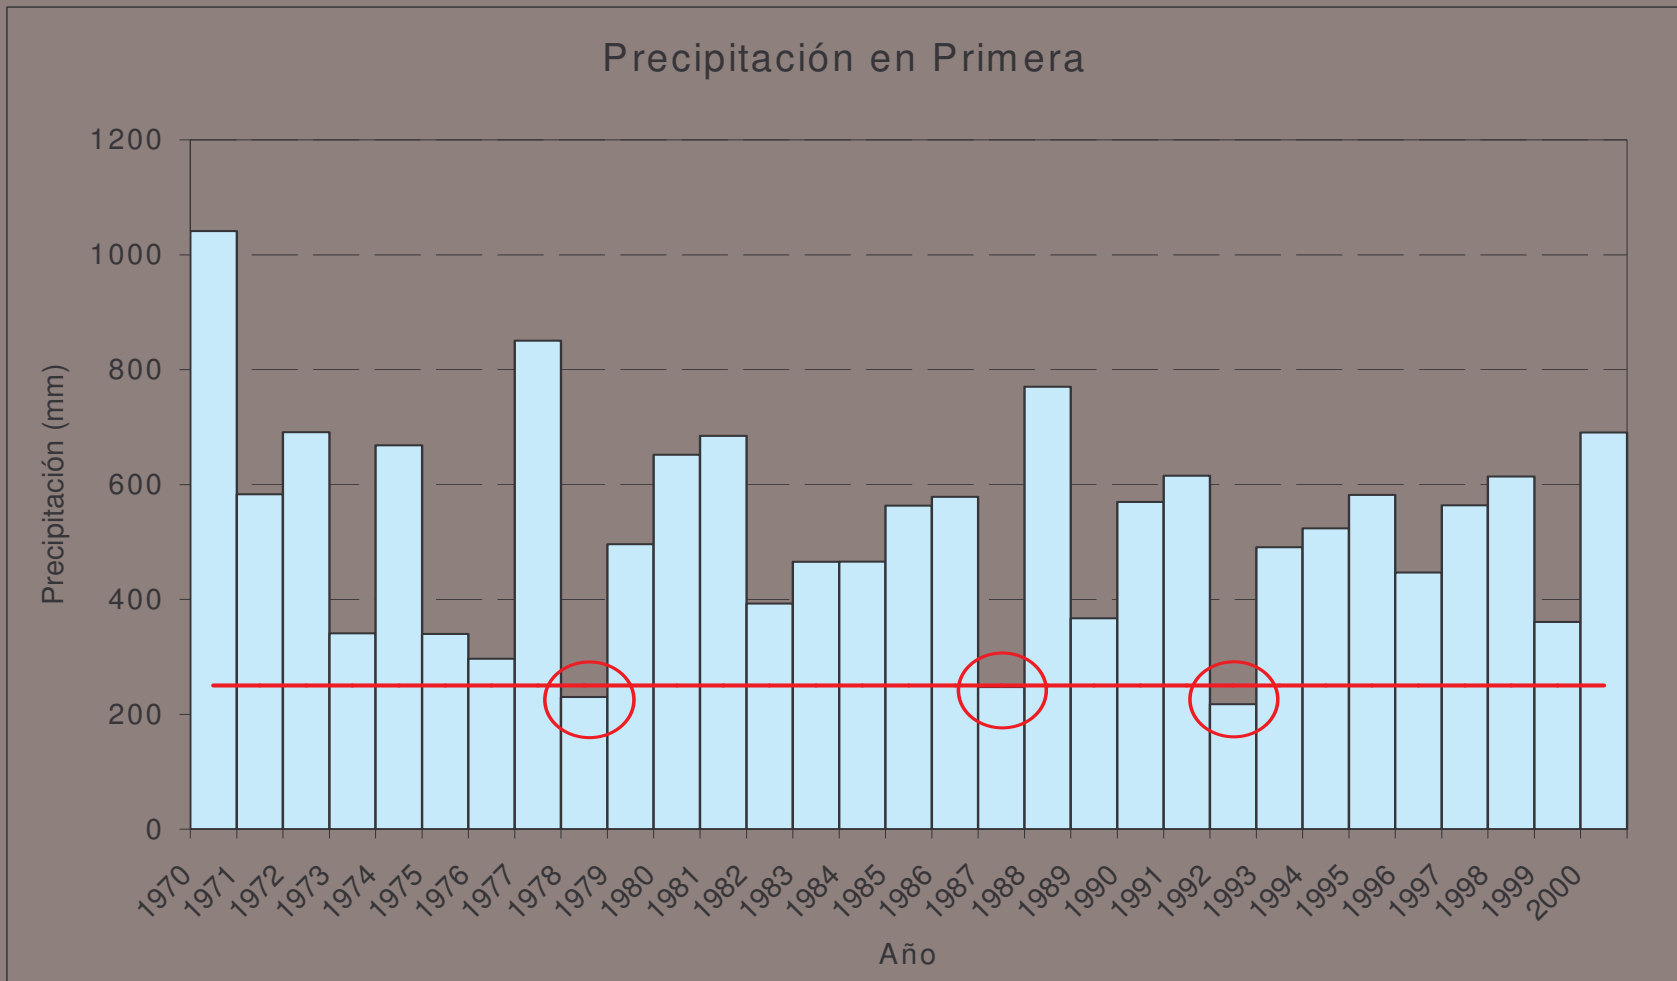

# Advantages of weather index insurance

- **Low cost: no need for inspections.**
- **No moral hazard:**
  - the insured cannot influence the weather
- **Less adverse selection:**
  - Both insurer and insured know that same amount about the weather risk
- **Weather data are measured independently by third parties**
  - *everyone sees the numbers.*

# An example of a weather index

“We will pay occurs if rain is < 250 mm between 1<sup>st</sup> May to the 31<sup>st</sup> July

# Basis of insurance

- **Let's agree:**

- A rainfall deficit of  $x$  mm results in a yield loss of  $Y$  kg/ha
- $X$  has a probability of (say) 10%,  $Y$  cost \$100
- To cover  $Y$ , the insurer will charge \$10

- **What rainfall deficit?**

- **What loss ?**

# Relate weather to yield

## Option 2: Generate weather and link to yield using crop simulation models

DSSAT  
Most crops  
modelled

Soils, slope, variety  
included

MarkSim

Generates 100 years of data

18 km grids over entire tropics

Daily rainfall, temp., s-rad

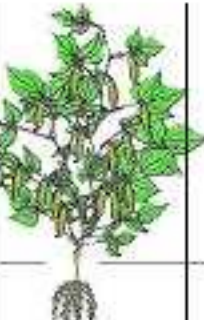

Simulate  
climate  
data

Rainfall deficit

# Method development

- Divide crop growth cycle into 10 day windows
- Identify the *rainfall* requirements for each window

										
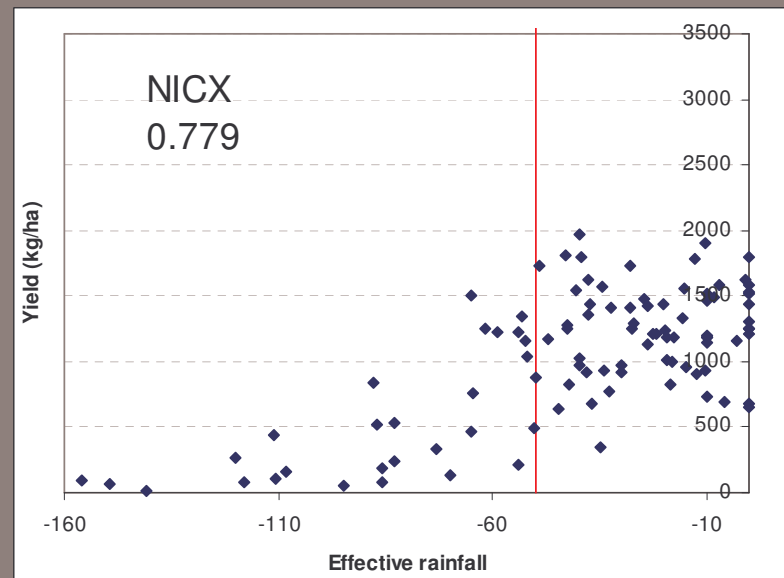

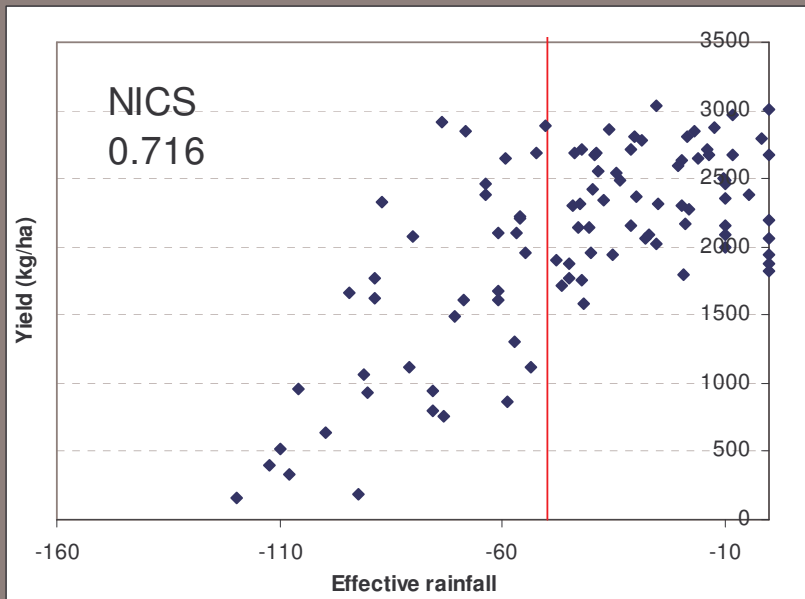

Barbecho (10 días antes de siembra)	Siembra y germinación (Días 1 - 10)	Crecimiento Días 11 - 20	Crecimiento Días 21 - 30	Floración Días 31 - 40	Floración Días 41 - 50	Floración / llenado de vaina Días 51 - 60	Llenado de vaina Días 61 - 70	Madurez Días 71 - 80		Días 81 - 90

# Correlation between rainfall index and loss

- Indices vary from place to place
- Rainfall is the main (not only) factor

# Example contract

<b>Place name:</b>	San Dionisio
<b>Reference grid cell:</b>	Lat 13.080, Long -86.410, Elev 914
<b>Reference weather station:</b>	San Dionisio
<b>Crop:</b>	Dry bean
<b>Reference soil type:</b>	Sandy loam
<b>Planting date rule</b>	First day when there is a cumulative rainfall of 30mm in 10 days
<b>Earliest planting date:</b>	15 <sup>th</sup> of April
<b>Latest planting date</b>	15 <sup>th</sup> May
<b>Effective rainfall payment trigger</b>	-70mm
<b>Premium Price:</b>	US\$1
<b>Indemnity Payment:</b>	US\$100

# Example contract

## Effective rainfall reference table

	Day 10 to day before planting	Day 1 to 10	Day 11 to 20	Day 21 to 30	Day 31 to 40	Day 41 to 50	Day 51 to 60	Day 61 to 70	Day 71 to 80	Day 81 to 90
Minimum rainfall (mm) for satisfactory growth (MIN)	0	10	10	25	40	40	40	30	10	0

## Calculation of payout

1. Payouts are based on the **rainfall deficits**
2. Weather station rainfall (OBS) is summed in blocks of 10 days starting from 10 days before the planting date up to day 90 after planting.
3. The planting date is established using the planting date rule above.
4. Rainfall deficits are calculated by subtracting the MIN from the OBS. Only negative values are taken into account.
5. The total deficit is calculated by summing the 10 day blocks of deficits.
6. If there is a deficit less than -70mm you are entitled to an indemnity payment

# Probability of a serious rainfall deficit (-70mm)
